

Barrier / BarrierXT

Recommended Installation Instructions

The Barrier and BarrierXT underconcrete insulation materials are the easiest and LEAST labor intensive under concrete insulation to install in underground applications on the market today. Just follow these simple steps and find out why installers rate this material “Easiest to Work With”.

1. Base material should be as level as possible, with all debris removed.
2. Unwind roll with tape edge up, then lay flat on base material. (Normally this is the white finish facing upwards)
3. Cut to length required - or roll up the footer form if desired to insulate the slab completely from heat and cold migration (recommended by NOFP).
4. Lay next roll down - be sure to butt edges together.
5. Peel back double faced adhesive backer and compress flange on tape (make sure rolls are tight together) Compress overlap tab firmly on previous roll edge. **It is important to make sure rolls are butted tightly together to create a gapless seam when you compress the double-faced adhesive tab.

Peel away backing of doubled sided taped edge
